

Configure the local web server and execute html files from it.

3. Create a basic HTML structure with some text according to any theme, use bold, italic, underlined.

Use at least 10 sentences.

4. Create 5 files in your local server (home, about, department, gallery, contact) and create sub folders to categories images, css and js files

Create a simple web page using the `<div>` tag that contains four sections: a header, a navigation bar, a main content area, and a footer, each clearly separated and labeled with appropriate text

Create the home layout with div tag, add some text and images according to your theme.

design a homepage main content area with three stacked `<div>` sections (each 200px height, different background colors) labeled "Services", "Portfolio", and "Testimonials".

Create an "About" page using `<div>` tags for these sections: header (company name), hero section (with profile image placeholder and bio paragraph),

features area (three side-by-side `<div>`s for "Experience", "Skills", "Mission" with icons/text), and footer (contact info).

Create a "Gallery" page using `<div>` tags structured as: header, main gallery container (with 6 image placeholders in 2x3 layout, each 200x200px div with border and hover effect), and footer.

Use placeholder text like "Image 1" inside each gallery.

Create a "Contact Us" page using `<div>` tags structured as: header, contact info section (three stacked `<div>`s for address, phone, email with icons) and also place the map image of the location and footer.

Use multiple div tags for proper arrangements of all elements

Create an HTML page for a restaurant menu that uses:

- An unordered list for menu categories (Starters, Main Course, Desserts).
- An ordered list (numbered) under "Main Course" to show top 5 best-selling dishes.

Create an HTML page for a "Web Technologies Course Outline" that contains:

- An ordered list for the sequence of modules (HTML, CSS, Bootstrap, JavaScript, PHP etc.).
- For the HTML module, an unordered sub-list showing topics (elements, attributes, lists, tables).

- A description list at the bottom defining three terms: ordered list, unordered list, and description list.

Restaurant Menu Table

Create an HTML page for a college restaurant menu using a table with 5 columns (Dish Name, Image, Price, qty available, offers).

Use an unordered list inside the first table cell to show dish categories (Appetizers, Main Course) and embed thumbnail images (``) in table cells for 8 dishes.

Design an HTML student leaderboard page with an ordered table (1st, 2nd, 3rd places) showing Rank, Student Name, Score, and Photo column with medal images.

Nest an unordered sub-list under each row for their top subjects, using `<img>` tags for student photos and medals.
